

Osa Peninsula Bird Checklist

With the chance to see more than 400 species of birds packed into such a small area, the Osa Peninsula of Costa Rica is one of the best places in the world to add birds to your life list. This checklist is designed not only to give you an idea of what birds occur on the Osa Peninsula, but also how likely it is for you to see them. It has been compiled using the distribution data provided in Garrigues and Dean's *The Birds of Costa Rica (Zona Tropical, 2007)* with valuable additions and observations provided by Liz Jones and Abraham Gallo. All abundance and distribution data were kindly provided by Liz and Abraham and give the visiting birder a very good idea of what you're likely to see and in what habitats. However, their data is biased to the Dos Brazos and Rincón area where they live and do most of their birding so that while this information acts as a good guide, you may find that certain species information varies considerably if you're in a different part of the Osa.

Occurrence: Here one day and gone the next

It is also worth bearing in mind that all species have some sort of patterns to their occurrence; nothing is static here. Besides the traditional north-south migration of temperate zone breeders, we observe many changes in the abundance of the "resident" birds as well. Many species, seemingly abundant in one part of the season, can become rather hard to turn up at other times. These changes, often quite abrupt, may be due to nesting, food availability, altitudinal migration, and other factors. The seasonal movements of many tropical species are still poorly understood and difficult to predict. Most notorious are frugivores such as cotingas, which may roam widely in search of fruiting trees. The erratic presence (or absence) of many hummingbirds is also notable.

Habitat: Variety is the spice of life

Each species on the list has been assigned one or more habitat codes, referring to where they are most often encountered. Some species like toucans and araçaris are very much generalists and can be found in a variety of habitats. Others such as the Uniform Crake, which is found almost exclusively in shady, wooded swamps, have a habitat preference that is more exact than we can express using a limited set of codes.

Key to Abundance Codes

1	Abundant: almost certain to be seen on any given day in the proper habitat
2	Common: seen on most days in the proper habitat
3	Fairly common: present in lower densities than 1 and 2; subject to more fluctuation
4	Uncommon: present in very low densities but still regular
5	Rare: present but not to be expected. Anywhere from one to a few records per year
6	Very rare: represented by just one or two sightings ever. Please report!

Key to Status Codes

All species are assumed to be year-round residents unless designated with one of the status codes listed

N	Nonbreeding "winter" resident, present mostly from September to May, depending on species
B	Breeding resident, present mostly from March to October, depending on species
i	Irregular, species may be common one year, absent in others.
T	Transient, present in passage only, mostly from September to May, depending on the species
L	Local transient, short distance migrant

Key to Habitat Codes

F	Forest
M	Mangroves
Fo	Forest- old growth
W	Waterways- rivers, lagoons, streams
Fy	Forest- younger successional areas, edges
S	Shore, including mudflats and tidal areas
Fr	Forest- higher ridges, 100m or more above the elevation of the lodge
O	Overhead, usually refers to soaring birds which may be seen over any habitat
P	Pastures and scrubby areas with low vegetation; also includes gardens and heliconias
